The MAILING DATE of this communication appears on the cover sheet with the correspondence address Period for Reply							
A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION. - Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication. - If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication. - Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).							
Status

Art Unit: 1744

DETAILED ACTION

Claim Rejections - 35 USC § 103

- 1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 2. The factual inquiries set forth in *Graham* v. *John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:
 - 1. Determining the scope and contents of the prior art.
 - 2. Ascertaining the differences between the prior art and the claims at issue.
 - 3. Resolving the level of ordinary skill in the pertinent art.
 - 4. Considering objective evidence present in the application indicating obviousness or nonobviousness.
- 3. Claims 23-32 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kinney et al.(US 4,001,460).

The reference of Kinney et al. discloses a tissue processing apparatus that includes a processing chamber (12); a fluid flow selector (39) for selecting the fluid flow to the processing chamber; at least one container of clearant agent (7, 8, 9); at least one container of contaminated dehydrant agent (10); at least one container of dehydrant agent (2-6); at least one container of an aqueous fluid (1); a plurality of first conduits (38); and a control device (100).

With respect to claim 23, the reference discloses a cleaning operation that includes sequentially contacting the chamber with the container of clearant (9), the container of

contaminated dehydrant (10) and an aqueous fluid or container (1) (See column 9, lines 13-56). However, the instant claim includes the additional steps of contacting the chamber with the container of dehydrant agent after the container of contaminated dehydrant agent and before the container of aqueous fluid.

However, in the absence of a showing of criticality and/or unexpected results, it would have been obvious to one of ordinary skill in the art at the time the invention was made to flush the chamber with "clean" dehydrant agent after contact with the contaminated dehydrant for the known and expected result of further cleaning or rinsing the chamber with an agent that is free of contaminants thereby further removing and/or limiting the contaminants that may be present prior to processing an additional tissue sample in the system.

Whether the cleaning discussed above is performed manually or automatically would have been clearly within the purview of one having ordinary skill in the art while providing the required sequence of steps as suggested above. Note, providing an automatic or mechanical means to replace a manual activity which accomplished the same result is not sufficient to distinguish over the prior art. (See In re Venner, 262 F.2d 91, 95, 120 USPO 193, 194 (CCPA) 1958)).

Note while the rejection as set forth above does not involve reprocessing of a tissue specimen, the specific reagents employed and sequence of regents meets the instant claim limitations.

With respect to claim 24, the container of clearant (9) is considered to be a contaminated clearant agent since it is used to clean the chamber after the infiltration steps. Furthermore, it would have been obvious to one of ordinary skill in the art to provide the additional step of

rinsing the chamber with "clean" clearant after contact with the contaminated clearant for the known and expected result of further cleaning or rinsing the chamber with an agent that is free of contaminants thereby further removing and/or limiting the contaminants that may be present prior to processing an additional tissue sample in the system.

With respect to claims 25 and 26, the chamber is cleaned with the contaminated clearant to remove infiltrating medium and is considered to be a purge clearant.

With respect to claims 27 and 28, the chamber is cleaned with the contaminated dehydrant to remove infiltrating medium and is considered to be a purge dehydrant.

With respect to claim 29, the infiltrating medium is paraffin.

With respect to claim 30, the rotary valve (39) is capable of connecting any of the containers to the chamber in any sequence.

With respect to claim 31, the device of Kinney et al. discloses the use of a rotary valve and the operation of the rotary valve to perform the sequence as suggested above would meet this claim limitation.

With respect to claim 32, the processing cycle that contacts the chamber with containers 1-8 and paraffin container I meets the limitations of this claim.

4. Claim 6 is rejected under 35 U.S.C. 103(a) as being unpatentable over Kinney et al. (US 4,001,460) in view of Louder et al.(US 4,399,433) and Muller et al.(EP 0 508 568).

The reference of Kinney et al. has been discussed above.

With respect to claim 6, while the reference of Kinney et al. discloses that is it known in the art to employ a pressure control system to transport the processing liquids to and from the

processing chamber and that it is known in the art to control the pressure within the processing chamber so as to improve the penetration of the tissue by the processing liquids (See column 7, lines 41-56), the reference is silent as to the use of a pressure sensor in fluid communication with the processing chamber.

With respect to the claimed pressure sensor, the reference of Louder et al. discloses that it is conventional in the art to provide a pressure sensor (24) in communication with a processing chamber (10) so as to monitor the pressure within the chamber and control the pressure control and flow in response to detected pressures in the processing chamber.

In view of this teaching and in the absence of a showing of criticality and/or unexpected results, it would have been obvious to one of ordinary skill in the art to provide the processing chamber of the reference of Kinney et al. with a pressure sensor for the known and expected result of providing an art recognized means for controlling and monitoring the pressure with respect to a tissue processing chamber. Monitoring the pressure within the chamber would be advantageous when providing the penetrating steps suggested by the reference of Kinney et al.

With respect to the claimed temperature sensor in fluid communication with the processing chamber, while the reference of Kinney et al. discloses a temperature regulation system (See column 7, lines 32-40), the reference fails to specifically disclose a temperature sensor in fluid communication with the processing chamber.

The reference of Muller et al. discloses that it is known in the art to provide a tissue processing chamber (112) with a temperature sensor for controlling the temperature of the processing chamber (See the processing chamber (112); temperature regulator (117) for

Art Unit: 1744

regulating temperature in the processing chamber and including a heater and sensor in communication with the processing chamber (112) (See page 20, lines 15-25)).

In view of this teaching, it would have been obvious to one of ordinary skill in the art at the time the invention was made to employ a temperature regulation system that includes a temperature sensor in fluid communication with the processing chamber for the known and expected result of providing an art recognized means for providing the temperature regulation required of the reference of Kinney et al.

With respect to the recited purge dehydrant and purge clearant and related sequence of contacting the processing chamber, see the discussion of the rejection of claims 23-32 above.

The purge dehydrant is the same as the contaminated dehydrant and the purge clearant is the same as the contaminated clearant.

Response to Arguments

5. With respect to the 35 USC 103 rejection of claims 23-32, Applicant argues (See pages 6-7 of the response dated 6/27/05) that the rejection is improper because instant claim 23 requires "at least one container of contaminated dehydrant agent, the contaminated dehydrant agent being contaminated with the clearant agent more that the dehydrant agent". Applicant stresses that container (10) of Kinney et al., which the Examiner has equated to the instantly claimed "at least one container of contaminated dehydrant agent", does not meet the instant claim language because the reference discloses the container (10) is identified as a solution of absolute alcohol. As a result, Applicant takes the position that a prima facie case of obviousness has not been

made and that the reference of Kinney et al. does not disclose or suggest the use of solutions that include contaminants.

In response, while the reference of Kinney et al. recites that container (10) is a container of absolute alcohol, the reference also discloses that the solution in tanks (15) is returned to their container (See column 4, lines 1-5). As a result, when the system is in use, one of ordinary skill in the art would recognize that the solution in container (10) becomes contaminated with (clearant) because the processing chamber (12) previously contains clearant and the solution of container (10) is contacted with the processing chamber (12) which contains residual clearant. For these reasons the Examiner is of the position that one of ordinary skill in the art would readily recognize that container (10), while initially containing absolute alcohol, would be contaminated with clearant after a number of processing cycles. The Examiner would like to point out that the contaminated or purge dehydrant disclosed in the instant specification is disclosed as 100% isopropyl alcohol (See station 15 on page 16 of the instant specification). Applicants consider this to be contaminated for the same reasons the Examiner considers container (10) of the reference of Kinney et al. to be contaminated.

6. With respect to claim 24, Applicant advances similar arguments. Applicant argues that the reference of does not disclose an apparatus including a container that holds a combination of clearant agent and infiltrating medium that form a "contaminated clearant agent" as required by claim 24.

In response, the Examiner maintains that while initially container (9) of Kinney et al. may not be contaminated, after a plurality of tissue processing cycles the container becomes

contaminated since the dehydrant is returned to the container after contacting the contents of the processing chamber which includes residual infiltrating medium. The Examiner maintains that one of ordinary skill in the art would clearly recognized this fact. The Examiner again points to Applicant's own specification which conveys to one of ordinary skill in the art that the container containing the contaminated clearant agent (purge clearant) is initially not contaminated but becomes contaminated during the tissue processing steps performed by the device.

Page 8

7. With respect to the rejection of claim 6 over the prior art combination of references including the reference of Kinney et al., Applicant argues (See pages 7-8 of the response filed 6/27/05) that the containers of Kinney et al. are used for cleaning the processing chamber when tissue is not present and therefore does not meet the claim limitations of claim 6 which state that the device includes a purge dehydrant for cleaning the processing chamber of clearant and a purge clearant for cleaning the processing chamber of infiltrating medium.

In response, the Examiner is of the position that the containers (9) and (10) of the reference of Kinney et al. meet these claim limitations. First, container (10) includes a dehydrant solution and is capable and in fact does clean the processing chamber of clearant in view of the fact that it is connected to the processing chamber after the processing chamber is contacted with clearant. The same holds true for container (9) which includes a clearant agent and is contacted with the processing chamber after the processing chamber has been contacted with infiltrating fluid. Where or not tissue is present in the processing chamber is immaterial because the instant claims are drawn to an apparatus and statements of intended use carry no patentable weight in apparatus-type claims.

For these reasons, the rejection of claims 6 and 23-32 has been maintained.

Conclusion

8. THIS ACTION IS MADE FINAL. Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

9. Any inquiry concerning this communication or earlier communications from the examiner should be directed to William H. Beisner whose telephone number is 571-272-1269. The examiner can normally be reached on Tues. to Fri. and alt. Mon. from 6:15am to 3:45pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, John Kim can be reached on 571-272-1142. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
